SUMMARY

Software Engineer working on the Quantitative Desk, with hands-on experience in high-performance C/C++ systems, low-latency real-time data processing, and financial trading technologies. Currently involved in building applications handling high-throughput market data streams, including UDP multicast feeds and FIX protocol integration. Passionate about low-latency systems, trading systems and continuously improving software reliability and performance in trading environments.

EDUCATION

D. Y. Patil College of Engineering Akurdi, Pune, B.E. ENTC
CGPA - 8.55

2024

SKILLS

Programming Skills: C++, SQL, Python, Java (basic)

Core Concepts: Object Oriented Programming, Data Structures, STL, Multithreading, Memory Management, Database Management

Systems: TCP/UDP Socket Programming, Low-Latency Systems, REST APIs (basic understanding)

Protocols: FIX Protocol, Market Data Feed Handling

Tools: Git, GitHub, Debugging

PROFESSIONAL EXPERIENCE

Software Engineer - Quantitative Desk, Findoc Investmart Private Limited 2025 – Present | Gift city, Gandhinagar, India

- Developed low-latency trading infrastructure for real-time financial data processing handling high-frequency market data streams ~1000+ messages per sec minimum.
- Built and maintained market data feed handlers for CME broadcasts, decoding binary messages from UDP streams.
- Designed and implemented FIX protocol-based communication systems, including message parsing, encoding, and session management.
- Developed multithreaded TCP, UDP socket systems to support multiple concurrent connections and real-time data distribution.
- Developed a contract master data processing engine to ingest, parse, and normalize NSE, BSE exchange data.
- Worked with real-time market data across Capital Markets domains — Equity and Derivatives NSE, BSE, CME — handling feed handlers and contract master data across multiple segments.

Johnson Controls | Graduate Engineer Trainee

2025 | Hyderabad

- Working on data analytics and system optimization for Integrated Building Management Systems (IBMS).
- Analyzing system performance identifying trends, and troubleshooting issues to improve system efficiency.
- Assisting in software-based configuration, reporting, and integration while coordinating with engineering teams for system enhancements and operational improvements.

TECHNICAL PROJECTS

Multi-Exchange Data Router & Monitoring Dashboard (C++, TCP/UDP, ImGui)

- Developed a scalable middleware system that ingests UDP market data and distributes it to multiple TCP-connected users.
- Built a granular filtering engine to route data based on specific user subscriptions Exchange, Segment, Token.
- Designed a UI to monitor the Exchange-to-User bridge, providing real-time visibility into the number of active exchanges connected and the live status of all TCP-connected clients.

FIX Protocol Trading Engine (C++)

- Developed a FIX-based trading communication system supporting order flow, execution messages, and session management.
- Implemented message parsing, encoding, heartbeat handling and session lifecycle management.
- Designed the system to maintain stable real-time communication across multiple message flows

Exchange Contract Master Processing Engine (C + MySQL)

- Built a scalable data ingestion pipeline to process NSE, BSE contract and security master data.
- Implemented file extraction ZIP, GZ, parsing of complex formats, and optimized bulk insertion into MySQL using transactions.

CME Market Data Feed Handler (UDP, C/C++)

- Designed a high-performance parser for CME broadcast feeds, handling real-time binary market data.
- Implemented efficient decoding logic and memory management to support high-throughput, low-latency processing.
